A note from the Guest Editors

The present issue of the Journal of Combinatorics is a belated Bondy 70+ *festschrift*! This issue collects research articles from Bondy's long time collaborators, colleagues, friends and former students/postdocs. We are grateful to all contributors of this issue who have kindly supplied their excellent work in graph theory to support this special issue in honor of Adrian Bondy.

We received a large number of submissions soon after the announcement. The articles presented in these pages constitute a selection of some best work that was submitted to the special volume. Some other excellent articles that have taken longer time to review will be published in regular issues.

We would like to express our appreciation to all reviewers for their work and efforts in keeping very high standards. We are also grateful to the editor-in-chief, Fan Chung and managing editor, Dr. Jacques Verstraete, for their constant and valuable support and technical help during the editorial process.
