Preface

An international workshop on computational mathematics and finance took place at University of Macau from 15th to 16th of December 2006. It was organized by the Department of Mathematics, University of Macau for the 25th anniversary of the university. The main theme of this workshop is the latest development in *computational mathematics and applications* and the papers involved in this proceedings cover this theme. There are eight invited speakers, four from Hong Kong, three from mainland China and one from Russia. The following is the list of invited speakers:

Prof. Raymond H. Chan of Chinese University of Hong Kong, Hong Kong.

Prof. Zhi-ming Chen of China Academy of Science, Beijing, China.

Prof. Wen Li of South China Normal University, Guangzhou, China.

Prof. Michael K. Ng of Hong Kong Baptist University, Hong Kong.

Prof. Wei-wei Sun of City University of Hong Kong, Hong Kong.

Prof. Eugene E. Tyrtshnikov of Russia Academy of Science, Moscow, Russia.

Prof. Yi-min Wei of Fudan University, Shanghai, China.

Prof. Qiang Zhang of City University of Hong Kong, Hong Kong.

There are 11 papers in this proceedings. The main contents of 6 papers, provided by invited speakers, are described briefly as follows.

A certain research paradigm suggests an approximate representation of initial and final data in numerically viable low-parametric formats to be maintained during computation. One of purposes is to show how theory and methods obtained recently for rank-structured matrices can be developed into theory and methods for rank-structured tensors. Specifically, **E. Tyrtshnikov** exposed a theory behind the 3D cross approximation algorithm together with its application to compression of petabyte-size data (1 petabyte = 2^{50} bytes) and preliminary results of design of iterative methods with rank-structured vectors.

Y. X. Wang, K. Du and **W. W. Sun** investigated fast algorithms for electromagnetic scattering from a two-dimensional rectangular open cavity embedded in an infinite ground plane. By introducing a transparent (artificial) boundary condition (Dirichlet-to-Neumann map), they reduced the problem in the open cavity to a bounded domain problem. Fast algorithms based on FFT were designed for solving the resulting discrete systems of the cavity models with layered media. Numerical experiments showed that the method is efficient and easy to implement as a preconditioner for cavity models with more general media.

E. S. Fung and **M. K. Ng** studied an interactive hidden Markov Model (IHMM) which is a variant of HMM. In the model, the observable symbols are affected by the hidden states and the hidden states are also affected by the observable symbols. They proposed and employed Non-negative Matrix Factorization (NMF) techniques to calibrate model parameters in IHMM. Numerical results were presented to illustrate NMF for IHMMs.

W. Li presented a computable formula of the structured backward errors for the discretization system of electromagnetic scattering from a large cavity. He showed that the structured stability of a method for solving this system is independent of the (1,1)-block structure of the coefficient matrix.

Inexact Krylov subspace methods are very effective in some scientific applications where the inexact matrix-vector product appears naturally. Several authors have studied different aspects of the use of inexact matrix-vector product in iterative methods. Using the Kronecker product-based technique, K. Du and **Y. M. Wei** generalized the existing results to global methods for matrix equations. The corresponding methods are called inexact global Krylov subspace methods. Some numerical experiments were reported to illustrate the results.

X. Q. Jin, W. Wang and **Y. M. Wei** analyzed the convergence rate of the GMRES method theoretically and numerically.

The success of the workshop should be credited to the enthusiastic participation of the attendees. The editors would like to thank all who contributed to this proceedings. We wish that the publication of the proceedings of the workshop may provide some inspiration and shed new light on current research in computational mathematics. The publication of the proceedings is supported by the research grant RG-UL/07-08S/Y1/JXQ/FST from University of Macau.

CONTENTS

	<u>page</u>
Preface	v
Chapter 1 Numerically Viable Structures and Large-Scale Matrices	1
by Eugene E. Tyrttyshnikov	
1.1 Introduction	1
1.2 Separation of variables and rank structures	3
1.3 Rank-structure transformations	6
1.4 Approximate iterations	9
References for Chapter 1	10
Chapter 2 Fast Algorithms for the Electromagnetic Scattering from Rectangular Cavities	13
by Ying-xi Wang, Kui Du and Wei-wei Sun	
2.1 Introduction	13
2.2 The electromagnetic scattering from the cavity	17
2.3 Numerical approximations	21
2.4 Numerical experiments	34
References for Chapter 2	35
Chapter 3 Nonnegative Matrix Factorization for Interactive Hidden Markov Models	39
by Eric S. Fung and Michael K. Ng	
3.1 Introduction	39
3.2 Discrete data modeling	40
3.3 Interactive hidden Markov models	44
3.4 Nonnegative matrix factorization	45
3.5 Numerical examples	50
3.6 Concluding remarks and future works	58
References for Chapter 3	60
Chapter 4 Structured Backward Error Analysis for Linear Systems from Electromagnetic Scattering	63
by Wen Li	
4.1 Introduction	63
4.2 Expression of $\eta^{(\theta)}(\tilde{x}, \tilde{y})$	65
4.3 Expression of $\eta^{(\theta, \lambda, \mu)}(\tilde{x}, \tilde{y})$	67
References for Chapter 4	71
Chapter 5 Inexact Global FOM and GMRES Methods for Solving Linear Systems with Multiple Right-Hand Sides	73
by Kui Du and Yi-min Wei	
5.1 Introduction	73
5.2 Inexact GI-FOM and GI-GMRES	75
5.3 Theory of inexact global Krylov subspace methods	79

5.4	Numerical tests	86
	References for Chapter 5	90
Chapter 6 On Convergence Rate of the GMRES		
Method		93
	by Xiao-qing Jin, Wei Wang and Yi-min Wei	
6.1	Introduction	93
6.2	Analysis of GMRES convergence	95
6.3	Numerical tests	99
	References for Chapter 6	100
Chapter 7 Numerical Comparison of Monte Carlo		
Methods for Linear Systems		103
	by Deng Ding, Xiao-qing Jin and Ying-ying Zhang	
7.1	Introduction	103
7.2	Monte Carlo almost optimal methods	106
7.3	Sequential Monte Carlo methods	111
7.4	Numerical results	114
	References for Chapter 7	117
Chapter 8 Numerical Solutions for Reflected Stochastic		
Differential Equations		119
	by Deng Ding and Ying-ying Zhang	
8.1	Introduction	119
8.2	Euler-type schemes	121
8.3	A splitting-step algorithm for RSDEs	125
8.4	Euler vs Milstein: numerical tests for RSDEs	132
	References for Chapter 8	136
Chapter 9 A Preconditioner from Crank-Nicolson		
Scheme for Systems of LMF-Based ODE Code		139
	by Jia-xun Hou and Hai-wei Sun	
9.1	Introduction	139
9.2	BVMs and their matrix forms	140
9.3	Crank-Nicolson matrix as a preconditioner	142
9.4	Numerical results	144
	References for Chapter 9	149
Chapter 10 Particle Motion in Stationary		
Homogeneous Isotropic Turbulence		151
	by Vai-kuong Sin	
10.1	Introduction	151
10.2	Mathematical model of simulated turbulence	152
10.3	Validation of the simulated turbulent flow field	154
10.4	Equations of particle motion	154
10.5	Results and discussion	156
	References for Chapter 10	161
Chapter 11 A Bound on Spectrum of Circulant		

Preconditioned Elliptic Operators	163
by Seak-weng Vong	
11.1 Introduction	163
11.2 Main estimate	164
References for Chapter 11	172
